

Service Climat Air Conditioning Air Conditioner

Reverse Cycle Ducted Air Conditioning

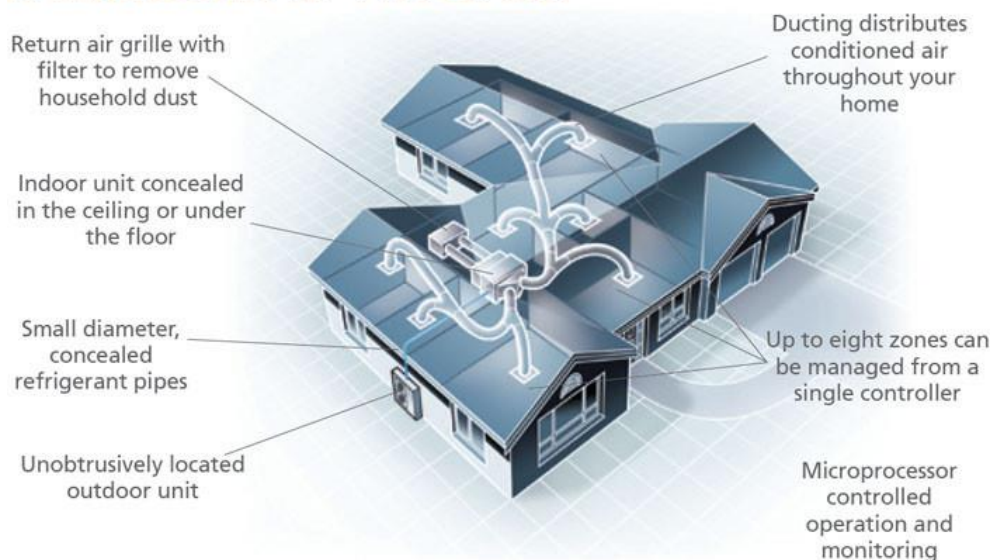

Reverse Cycle Ducted Air Conditioning System provide discreet air conditioned comfort throughout your entire home. The ducted system can be installed in a new home or tailored to suit an existing one, and once installed only the controller, the return air grill and discharge vents are visible inside your home. With up to 60 months payment options*, there will never be a better time to call Climat for a quote.

Types of Reverse Cycle Ducted Air Conditioning

There are two main types of reverse cycle air conditioning systems used in homes these days, split console & split ducted. Therefore offering an air conditioning solution for most homes.

DAIKIN DUCTED AIR – AT A GLANCE

A split system is in 2 main parts,

1. an air handling unit (indoor unit) which can be in the roof space for a ducted system
2. the condenser (outdoor unit) which needs good ventilation around it and is usually positioned against an outside wall of the home away from the area to be cooled. The outside unit will make some noise, therefore you will want to position it to comply with any council regulations to not annoy neighbors.

The split system is the main type in use today as opposed to a "package" or "all in one unit" which is rarely used except in very rare circumstances due to noise and many other limitations.

Split systems are available in both inverter and fixed speed systems. "Inverter" units have a variable output which is ideal for cooling. "Fixed speed" units are a great choice for both cooling and also where heating is a priority. The modern fixed speed with inverter hybrid systems offer the best of both worlds.

Split Ducted Reverse Cycle

Split ducted systems are designed to give cooling and heating with the least inside noise and provide the most (even) coverage from a system of a given size. A ducted system will often provide comfort to more than 1 area at a time and as a result are suited to homes needing multi-room solutions.

Split Console Reverse Cycle

Split console systems include "wall splits", "cassettes" which are fitted nearly flush with the ceiling and other consoles which can be mounted closer to the floor or on a level ceiling. Therefore, they are ideal for one or a few rooms.

Split Variable Refrigerant System

Split Variable Refrigerant is a very modern & advanced type of system which can incorporate both Room/Split and/or ducted systems all running from the one outdoor unit. It offers potential for massive energy savings at the same time as much greater control and flexibility.

Leading Brands

Climat supplies many brands of Reverse Cycle Air Conditioner including the popular, reliable and energy efficient

- **Daikin**
- **Mitsubishi Electric**
- **Toshiba**
- **LG**
- **Samsung**
- **Carrier**

We use and recommend Polyaire ducting, components, fittings and air control systems. These components are highly advanced & energy efficient.

Climat Reverse Cycle Ducted systems come with a 5 year product warranty (optional 7 year warranty also available) and 5 year installation warranty; for reliability and your peace of mind.
